

## K.S. INSTITUTE OF TECHNOLOGY, BANGALORE - 560109 2nd SESSIONAL TEST QUESTION PAPER 2018–19 Even SEMESTER

| USN |  |  |  |  |  |
|-----|--|--|--|--|--|

Degree : B.E Semester : IV

Branch : Computer Science & Engineering Subject Code : 17CS43

Subject Title: Design and Analysis of Algorithms
Duration: 90 Minutes
Date: 2019-04-16
Max Marks: 30

Note: Answer ONE full question from each part.

| Note: Answer ONE full question from each part. |                                                                                                                                                                                                                                                                                                                                                                                         |       |                        |               |  |  |  |

| Q<br>No.                                       | Question                                                                                                                                                                                                                                                                                                                                                                                | Marks | K Level                | CO<br>mapping |  |  |  |
|                                                | PART-A                                                                                                                                                                                                                                                                                                                                                                                  |       |                        | 11 0          |  |  |  |
| 1(a)                                           | Use Divide and conquer approach and <b>construct</b> an algorithm to find $\mathbf{k}^{\text{th}}$ smallest element in the given sequence of $\mathbf{n}$ elements. Hint: Use the idea of quicksort except that only one sub-problem has to be solved. Identify which subsequence contains the $\mathbf{k}^{\text{th}}$ smallest element and use that subsequence to find the solution. | 5     | Applying               | CO2           |  |  |  |
| (b)                                            | Make use of fractional knapsack algorithm to build a solution for the instance n=7, knapsack size m=15, profits $p_1$ =10, $p_2$ =5 $p_3$ =15, $p_4$ =7, $p_5$ =6, $p_6$ =18, $p_7$ =3, and weights as $w_1$ =2, $w_2$ =3, $w_3$ =5, $w_4$ =7, $w_5$ =1, $w_6$ =4, $w_7$ =1.                                                                                                            | 5     | Applying               | CO2           |  |  |  |
| (c)                                            | Consider that a country has coins in the denominations of Rs 14, 12, 5, and 1. <b>Show</b> an example value to prove that greedy algorithm always does not generate change with minimum number of coins.                                                                                                                                                                                |       | Under-<br>standing     | СО3           |  |  |  |
|                                                | OR                                                                                                                                                                                                                                                                                                                                                                                      |       |                        |               |  |  |  |
| 2(a)                                           | <b>Analyze</b> time complexity for QuickSort in worst case. Hint: Define and explain the recurrence relation for worst case and solve the same.                                                                                                                                                                                                                                         | 5     | Analyzing              | CO2           |  |  |  |
| (b)                                            | Consider <i>Dijkstra's</i> algorithm to find the single source shortest path for a weighted graph. <b>Identify</b> the changes that you need to make in this algorithm to find a shortest path between given two vertices i.e. <b>develop</b> the algorithm for single-pair-shortest-paths problem.                                                                                     | 5     | Applying               | CO3           |  |  |  |
| (c)                                            | Apply the algorithm developed in Q2(b) to find the shortest path from node F to node B. Compare the path thus found using this algorithm with actual shortest path and explain the difference.                                                                                                                                                                                          | 5     | Applying,<br>Analyzing | СО3           |  |  |  |
|                                                | PART-B                                                                                                                                                                                                                                                                                                                                                                                  |       |                        |               |  |  |  |
|                                                |                                                                                                                                                                                                                                                                                                                                                                                         |       |                        |               |  |  |  |

| 3(a) | <b>Illustrate</b> the product $P(x)*Q(x)$ computation manually using divide and conquer multiplication approach for following polynomials. $P(x) = 0+1x+2x^2+3x^3++7x^7$ $Q(x) = 8+7x+6x^2+5x^3++1x^7$                          | 5 | Under-<br>standing | CO2 |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|--------------------|-----|
| (b)  | <b>Construct</b> a Minimum Cost Spanning Tree using Prim's algorithm for the graph shown in Q2(c) starting from node C as the root of the spanning tree. Please note that some edges have negative weights associated with them |   | Applying           | соз |
| (c)  | <b>Analyze</b> the time complexity of <i>Prim's</i> algorithm using both <i>Adjacency Martrix</i> and <i>Adjacency List</i> representation.                                                                                     | 5 | Analyzing          | CO3 |
|      | OR                                                                                                                                                                                                                              |   |                    |     |
| 4(a) | For the graph below, Identify and <b>List</b> all possible topological sorting orders.                                                                                                                                          | 5 | Applying           | CO2 |
| (b)  | <b>Analyze</b> the time complexity of Kruskal's algorithm using <i>Union-Find</i> with fixed cost of Union operation as $O(1)$ and varying cost of Find operation.                                                              |   | Analyzing          | CO3 |
| (c)  | Consider the graph as shown in Q2(c), and <b>develop</b> Union Find trees to check for cycle formation when considering each edge for Minimum Cost Spanning Tree.                                                               | 5 | Applying           | СО3 |
