Transitive Closure

- Computes the transitive closure of a relation
- Alternatively:
 - existence of all nontrivial paths in a digraph
- Example of transitive closure:

Warshall's Approach

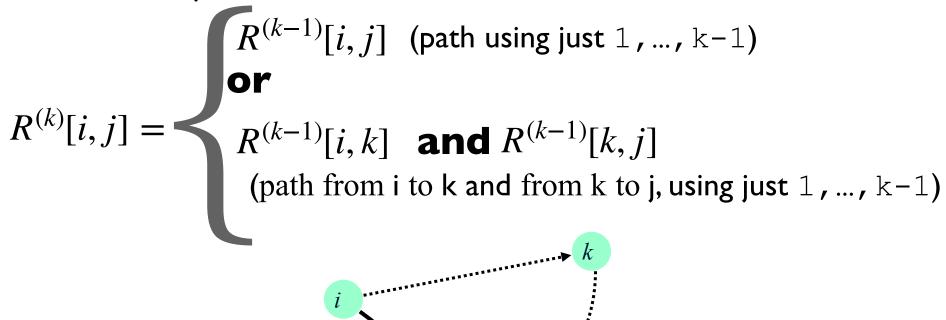

• Constructs transitive closure T as the last matrix in the sequence of n-by-n matrices

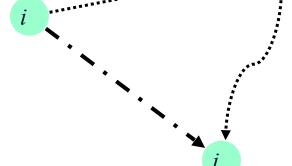

```
R^{(0)}, ..., R^{(k)}, ..., R^{(n)} where
```

- $R^{(k)}[i,j]=1$ iff
 - there is nontrivial path from i to j
 - with only the first k vertices (numbered from 1 to k) are allowed as intermediate
- Note that
 - $-R^{(0)} = A$ (adjacency matrix),
 - $-R^{(n)} = T$ (transitive closure)

Warshall's algo: Recurrence

- On the k^{th} iteration,
 - the algo determines for every pair of vertices i, j
 - if a path exists from i and j
 - with just vertices 1, ..., k allowed as intermediate

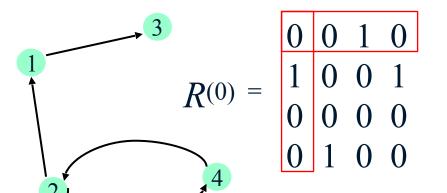

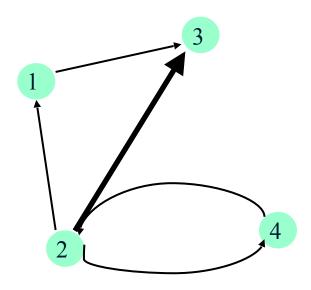

Warshall's algo: Matrix Generation

- Recurrence relating elements $R^{(k)}$ to elements of $R^{(k-1)}$ is:
 - $R^{(k)}[i,j]=R^{(k-1)}[i,j]$ or $(R^{(k-1)}[i,k]$ and $R^{(k-1)}[k,j]$)
- It implies the following rules for generating $R^{(k)}$ from $R^{(k-1)}$:
 - Rule 1: If an element in row i and column j is 1 in $R^{(k-1)}$, it remains 1 in $R^{(k)}$
 - Rule 2: If an element in row i and column j is 0 in $R^{(k-1)}$,
 - it has to be changed to 1 in $R^{(k)}$ iff the element in its row i and column k and the element in its column j and row k are both 1's in $R^{(k-1)}$

Warshall's algo: Example

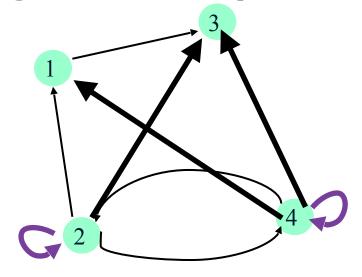

$$R^{(1)} = \begin{array}{c} 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{array}$$

Warshall's algo: Example

$$R^{(1)} = \begin{array}{c|ccc} 0 & 0 & 1 & 0 \\ \hline 1 & 0 & 1 & 1 \\ \hline 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{array}$$

$$R^{(2)} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ \mathbf{1} & 1 & \mathbf{1} & \mathbf{1} \end{bmatrix}$$

$$R^{(3)} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ \hline 1 & 1 & 1 & 1 \end{bmatrix}$$

$$R^{(4)} = \begin{array}{cccc} 0 & 0 & 1 & 0 \\ 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 \end{array}$$

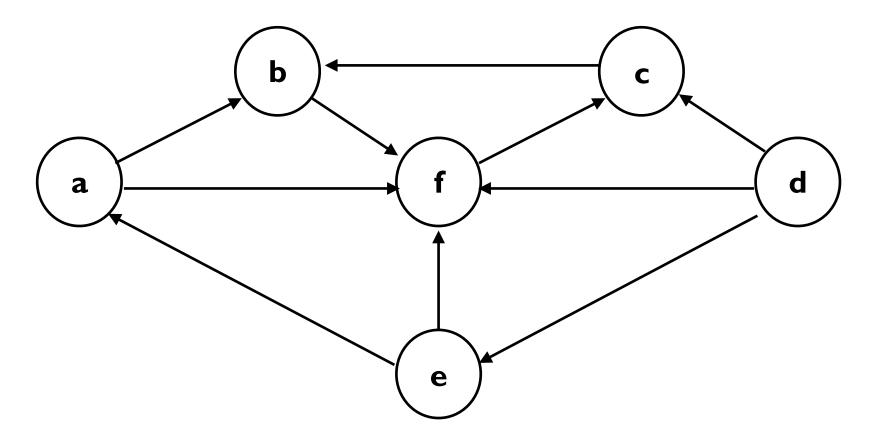

No Change

Warshall's Algo: Analysis

```
Algo Warshall (A[1..n,1..n])
// i/p:Adjacency matrix A of a diagraph with n vertices
// o/p:Transitive closure of diagraph
R^{(0)} \leftarrow A
for k \leftarrow 1 to n do
   for i \leftarrow 1 to n do
       for j \leftarrow 1 to n do
           R^{(k)}[i,j] \leftarrow R^{(k-1)}[i,j] OR
               (R^{(k-1)}[i,k] \text{ AND } R^{(k-1)}[k,j])
return R<sup>(n)</sup>
Time efficiency: \Theta (n^3)
Space efficiency:
   Matrices can be written over their predecessors (with
   some care), so it's \Theta(n^2).
```

Exercise:

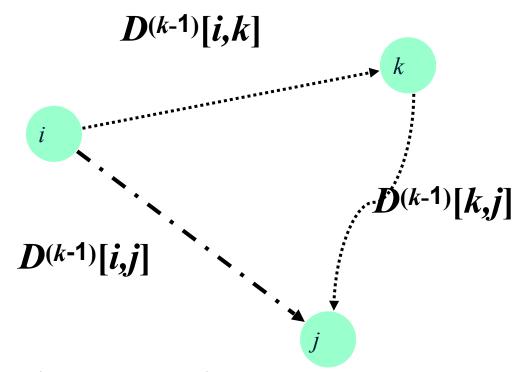

• Ex: Construct transitive closure for below graph

Floyd's Algorithm: Matrix Generation

- On the k^{th} iteration,
 - the algorithm determines shortest paths between every pair of vertices i, j that use only vertices among 1, ..., k as intermediate

$$D^{(k)}[i,j] = \min \{D^{(k-1)}[i,j], D^{(k-1)}[i,k] + D^{(k-1)}[k,j]\}$$

Example: Floyd Algo

$$\begin{array}{c|c}
1 & 2 \\
2 & 3 \\
\hline
3 & 1
\end{array}$$

$$D^{(0)} = \begin{bmatrix} 0 & \infty & 3 & \infty \\ 2 & 0 & \infty & \infty \\ \infty & 7 & 0 & 1 \\ 6 & \infty & \infty & 0 \end{bmatrix} \qquad D^{(1)} = \begin{bmatrix} 0 & \infty & 3 & \infty \\ 2 & 0 & 5 & \infty \\ \infty & 7 & 0 & 1 \\ 6 & \infty & 9 & 0 \end{bmatrix}$$

$$D^{(1)} = \begin{array}{c|cccc} 0 & \infty & 3 & \infty \\ \hline 2 & 0 & 5 & \infty \\ \hline \infty & 7 & 0 & 1 \\ 6 & \infty & 9 & 0 \end{array}$$

$$D^{(2)} = \begin{array}{c|ccc} 0 & \infty & 3 & \infty \\ 2 & 0 & 5 & \infty \\ \hline 9 & 7 & 0 & 1 \\ 6 & \infty & 9 & 0 \end{array}$$

$$D^{(3)} = \begin{cases} 0 & \mathbf{10} & 3 & \mathbf{4} \\ 2 & 0 & 5 & \mathbf{6} \\ 9 & 7 & 0 & 1 \\ \hline \mathbf{6} & \mathbf{16} & 9 & 0 \end{cases}$$

$$D^{(4)} = \begin{array}{cccc} 0 & 10 & 3 & 4 \\ 2 & 0 & 5 & 6 \\ 7 & 7 & 0 & 1 \\ 6 & 16 & 9 & 0 \end{array}$$

Floyd Algo: Analysis

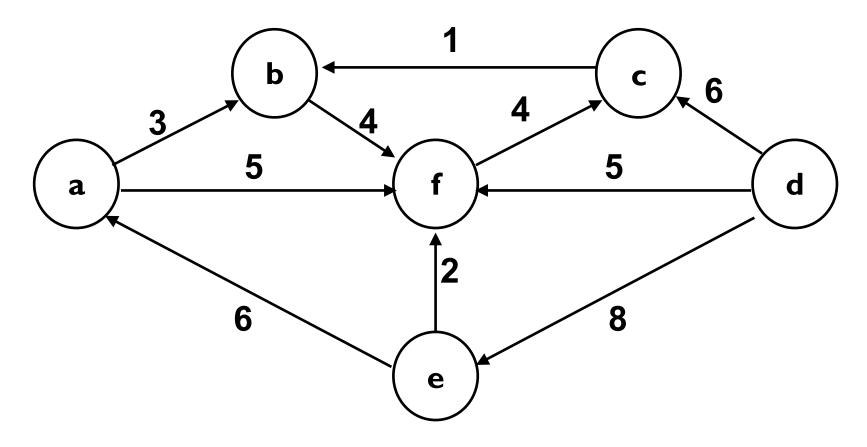

```
Algo Floyd (A[1..n,1..n])
// i/p:Weight matrix W of a diagraph A with n vertices
// o/p: Distance matrix of shortest path lengths
D \leftarrow W
for k \leftarrow 1 to n do
   for i \leftarrow 1 to n do
      for j \leftarrow 1 to n do
          D[i,j] \leftarrow min\{D[i,j],D[i,k]+D[k,j]\}
          if D[i,k]+D[k,j] < D[i,j] then
             P[i,j] \leftarrow k
return D
```

Time efficiency: Θ (n^3)

Space efficiency: Matrices can be written over their predecessors (with some care), so it's $\Theta(n^2)$.

Exercise:

• Ex: Find all pair shortest distance for below graph

Summary

- Transitive closure
- Warshall Algorithm
- Floyd Algorithm
